Name: _____ Period: _____

What Do You Already Know About Carbon?

Step 1: Draw it (on your own, 2 minutes)

Draw how carbon moves around Earth. Use arrows to show where carbon goes. Label each arrow with a process if you know one.

Step 2: Compare (with a partner, 2 minutes)

Check each sphere that appears in **your** drawing.

☐ Atmosphere (air)	☐ Biosphere (living things)	☐ Hydrosphere (water)	☐ Geosphere (rocks)

Step 2b: Put a **B** next to each arrow you learned in biology. Put a ★ next to each arrow that involves rocks. Which arrows do you think take longer to move carbon, the B arrows or the ★ arrows?

Step 3: Recall (1 minute)

Which sphere stores the **most** carbon on Earth? How do you know?

Building on Biology

In biology, you learned how carbon moves through living things. Plants take in CO_2 during photosynthesis, and living things release it during respiration and decay. These processes are fast, taking days to years. In Earth Science, we add the rest of the system: the ocean and rocks. Carbon can be locked in limestone and fossil fuels for millions of years, and rocks are where most of Earth's carbon is stored.
